

METHOD AND SYSTEM FOR CONTROLLING PRODUCTION AND EXPORTATION

ABSTRACT

A method and a system for controlling production and exportation are proposed, for connecting trading branches of an enterprise to the system for controlling production and exportation via a network, wherein the system for controlling production and exportation shares client orders with the trading branches for product exportation, so as to improve business performances for the trading branches, and enhance profits for the enterprise. In this case, received client order data are processed in a manner as to be transferred suitable trading branches for product manufacture and exportation. This therefore makes products to be cost-effectively manufactured, and provides the business performances for required trading branches, thereby enhancing confidence of investors to the trading branches and increasing overall profits and achievements for the enterprise.
